METAL CEILINGS

Directions for Measuring.

First take the actual dimensions of the room in feet and inches, then add to each dimension twice the depth of the Cornice to be used. Add to this 4 inches for variation. For example, take a room the measurements of which are 15 feet 0 inches by 39 feet 0 inches.

If your cornice extends down on the wall 12 inches, add 24 inches to each dimension, and then add 4 inches for variation to each dimension, which is tabulated as follows:

Size of room.....	15 ft.	0 in.	x	39 ft.	0 in.
Cornice.....	2 "	0 "	x	2 "	0 "
For variation.....	0 "	4 "	x	0 "	4 "
Total.....	17 ft.	4 in.	x	41 ft.	4 in.

We now have the dimensions, 17 ft. 4 in. x 41 ft. 4 in.; multiplied, gives the actual number of square feet of metal in the entire ceiling, cornice, etc., namely, 716 square feet. Do not deduct for openings in the ceiling, such as stairways, skylights, elevator openings, etc., unless they exceed 100 square feet each.

The deeper the cornice, the greater the cost of the material. The selection of its depth should be governed by the height of the ceiling. For a room 12 ft. high the depth of plate must be considered in making a selection of designs. After the selection has been made and the price agreed upon, multiply the cost of the metal by the square feet in the ceiling. To this must be added the cost of labor for erecting.

Directions for Applying.

Always begin to lay off ceiling at center line and work each way to walls. Strike chalk lines the length of the room at distances shown by lines on working plan which indicate the centers of lapping beads on the plates and mouldings. On these lines nail $\frac{7}{8}$x1$\frac{1}{4}$ inch furring strips. Cut cross strips to fit between these strips and place them as shown by lines on working plan. Nail strips in angle of ceiling and wall at a distance from wall equal to the projection of the cornice to receive the cornice brackets. Strips should be brought to a level by driving wedges between the strips and old ceiling or joists, or the ceiling will present an uneven appearance when finished.

The field should be applied first, then the Cornice, Mold, and last, the Filler. The Filler is always sent 1 or 2 inches wider than the dimensions of the room call for to provide for any unevenness in the walls. Place the bead on the filler so as to cover the flange on the cornice and slip the other side of filler under the bead on the mold, then nail the mold tight. Use a sharp punch for making nail holes where there are more than two thicknesses of metal. Close or swedge with a small, dull tool any joints which may not have lapped tightly.

Ceiling Plate No. 4101
